

NFPA 58 BULK TRANSPORT DIMETHYL ETHER TANK FARMS
DOT HM 225A DCE APPROVAL MC331
PROPANE ANHYDROUS AMMONIA NEC

New Passive Shutdown System from MSA!

MSA brings 75 years of gas detection experience to the trucking industry and is pleased to offer a product specifically designed to meet the passive shutdown requirements for bulk transports (DOT HM 225A) and bulk tank farms (NFPA 58).

This reasonably-priced system utilizes gas detection to trigger valve shutdown; closing discharge, fill and vapor lines, and in the event of hose separation, hose leak or valve leak. The system provides increased worker safety by monitoring the entire area for potential leak situations. Both UL and DCE approved, the system detects for propane, anhydrous ammonia and dimethyl ether and includes a failsafe mode that closes all valves on loss of power and brake engagement.

The MSA Passive Shutdown System is constructed in a rugged, stainless steel enclosure. It has proven to be exceptionally reliable with numerous installations already in place, covering thousands of miles in all types of weather conditions. This system is simple to install and features user-friendly operating LEDs and a text-messaging display.

Distributor and dealer networks are now being set up with nationwide MSA service support capabilities already in place. Please contact us at 800.MSA.INST for additional information.

Thank you for giving us this opportunity to introduce our product.
