FOR IMMEDIATE RELEASE

MSA's CHIPS Communication System offers unique headset configurations

Pittsburgh, Pa., July 2009 — MSA's CHIPS Communication System integrates with MSA's Advanced Combat Helmet (ACH) to provide communication configurations, clear radio communications, and hearing protection for areas where weapons may be fired. System consists of a user-selectable head communication component, an intelligent PTT module, and connectors that interface with military communication radios and military vehicle intercom systems. Unobtrusive microphone/sound transmission system works alone or with MSA's ACH ballistic shell. Unique design offers tri-com configurations and recognizes hardware changes with voice reminder.
